Corrections for Co-Authors

Kashmir Route-Rationalisation Paper • authoritative numbers supersede the earlier shared draft

Why you are reading this. The version of the report circulated earlier was an *old* draft. Since then the plan was re-scoped to the full Kashmir Division and re-run several times (engine now frozen at **v3.4.5-geo**). The numbers in this repository (`paper/CLAIM_LEDGER.md`) and on the live dashboard are the current, authoritative set — we built the engine, so those are the definitive figures. Please replace any legacy numbers in your sections with the "NEW" column below. Every corrected value cites a Claim-Ledger ID (`CL-xx`) so it can be traced to the exact module that produced it.

The eight headline numbers

614 permit records `CL-01`	**157** distinct corridors `CL-02`	**186** active routes `CL-06`	**1,011** buses (+68.5%) `CL-36`
37.4% Euclidean overstatement `CL-26`	**24.2%** division coverage `CL-28`	**6.58M** residents (denominator) `CL-11`	**2,526** GPS service runs (supply-side) `CL-18`

What changed, line by line

Study area	~~Srinagar Metropolitan City~~	**Kashmir Division — all 10 districts**	The plan and denominator span the whole division, not one municipality.	`scope`
Permit base	~~342 permits~~	**614 permit records**	The 342 figure counted only a geocoded subset; the full digitised register is 614.	`CL-01`
Route count	~~207 routes~~	**186 active routes (32 trunk / 154 feeder)**	207 included unmerged duplicate trunks; 186 is the reconciled active set.	`CL-06`
"Reduction"	~~39% route reduction~~	**99.4% corridor retention (156/157)**	The apparent cut is a change of accounting unit (permits→corridors), not lost coverage.	`CL-07, CL-08`
Population served	~~95.7% coverage~~	**24.2% of division (network walkshed)**	Old % used a ~1.66M Srinagar denominator + straight-line buffers; corrected to 6.58M + walk network.	`CL-28`
Fleet size	~~~1,009 buses~~	**1,011 buses (187 HPV / 754 MPV / 70 LPV)**	Re-anchored to GPS-measured cycle times in engine v3.4.5.	`CL-36`
Denominator	~~~1.66M (Srinagar UA)~~	**6,584,762 residents (10 districts)**	WorldPop 2026 zonal sum over the district union; single denominator for every share.	`CL-11`
Validation claim	~~"Validated against ridership"~~	**Supply-side observational GPS validation**	Driver GPS carries no ridership signal; the plan is decision-robust, not demand-validated.	–
Engine baseline	~~"v4" / mixed versions~~	**v3.4.5-geo (frozen)**	The authoritative operational baseline is frozen at v3.4.5-geo.	–

Three framing points to keep consistent across all sections

1. It is not a route cut. The plan *retains* 156 of 157 physical corridors and adds 30 e-bus routes. The headline "71% reduction" is almost entirely a change of unit (collapsing duplicate permits onto the same corridor), not places losing service. Say "rationalised frequencies and fleet," not "cut routes." [CL-07, CL-08]

2. Coverage is quoted on the walk network against residents. The central methodological result is that straight-line buffers overstate population served by ~37% per route; corrected division coverage is 24.2% of 6.58M, not 95.7% of a

metro figure. [CL-26, CL-28]

3. Validation is supply-side only. We never write “validated against ridership.” The GPS layer validates geometry, speed, run time, and fleet arithmetic — the supply chain. The honest claim is *decision-robust, not demand-validated.*

Authoritative source: `paper/CLAIM_LEDGER.md` (CL-01–CL-36) in the paper-companion repository, and the live dashboard. Barred legacy terms are listed in that ledger, §4. Questions on any number → the engine team.
